Understanding the EM-DAT Disaster Classification System

The Main Classification System

The EM-DAT international disaster database (www.emdat.be) categorizes more than 25,800 disasters by their triggering hazards. Each disaster entry is linked to a single hazard, using a hierarchical classification tree with five levels: group, subgroup, type, subtype (optional), and sub-subtype (optional). At the root "group" level, EM-DAT classifies disasters into three categories: Natural Hazards (66 %), Technological Hazards (33 %), and Complex Disasters (14 entries only)¹.

EM-DAT's classification system originally started with a simple 20-type list [1] but has since become more complex. To ensure consistency between different database providers and operators, CRED worked with Munich Re - managing the NatCatSERVICE Database - to develop a standard classification system and glossary in 2009 [2]. This effort expanded to involve other stakeholders and operators, resulting in the adoption of the IRDR Peril Classification and Hazard Glossary [3] in 2014, i.e., the current reference for classifying Natural hazards in EM-DAT. Figure 1 provides an overview of the present hazard groups and their corresponding types.

Geophysical	Hydrological	Meteorological	Climatological	Biological	Extra-terrestrial
Earthquake	Flood	Storm	Drought	Animal accident	Impact
Mass Movement (dry)	Landslide	Extreme temperature	Glacial lake outburst	Epidemic	Space weather
Volcanic activity	Wave action	Fog	Wildfire	Insect infestation	

Figure 1: Natural Hazards Subgroups and Types in the IRDR Peril Classification and Hazard Glossary [3]

The IRDR Peril Classification and Hazard Glossary is not cast in stone and can be adapted by disaster databases to suit their needs. The document was introduced as a glossary serving as a reference for developing a classification system. Accordingly, the EM-DAT classification of natural hazards doesn't match the IRDR reference completely. Some differences are found in the subtype and sub-subtypes levels (see Table 1).

¹ As of February, 2023.

Table 1

→ Type list

→ Occurrence

Table A-X

→ Definitions

Only Mass **Disasters** with a Certain Impact Are Classified

What **Disasters**?

✓ Unintentional

✓ Unforeseen

✗ No conflict

✗ No terrorist attack

EM-DAT Inclusion Criteria

1 10 or more persons reported killed

2 100 or more persons reported affected

3 A call for international assistance

4 A declaration of a state of emergency

Disasters Are Classified According to their Trigger: Hazards

Triggering event

Natural or
Technological
Hazard

Extreme physical
phenomenon

Influencing factors

- Exposure
- Vulnerability
- Capacity

Resulting event

Disaster (impact)

- Killed people
- Affected people
- Economic damage
- ...

EM-DAT Classification Has Changed since 1992 (1)

List of Disaster Types recorded in EM-DAT

1	Accident	Earthquake	Insect Infestation
	Avalanche	Epidemic	Landslide
	Chemical accident	Famine ✖	Storm
	Civil Strife ✖	Fire	Tsunami
	Cyclone	Flood	Typhoon
	Displaced persons ✖	Heat/cold wave	20 Volcano
	Drought	Hurricane	

✖ Not in EM-DAT anymore ✖ Now associated disasters

Guha-Sapir, D. and Misson, C.: The Development of a Database on Disasters, Disasters, 16, 74–80, <https://doi.org/10.1111/j.1467-7717.1992.tb00378.x>, March 1992.

The Current EM-DAT Reference for Classification (2014)

The 6 **Natural Hazards** Groups and their types

Geophysical	Hydrological	Meteorological	Climatological	Biological	Extra-terrestrial
Earthquake Mass Movement (dry) Volcanic activity	Flood Landslide Wave action	Storm Extreme temperature Fog	Drought Glacial lake outburst Wildfire	Animal accident Epidemic Insect infestation	Impact Space weather

Working Group: 16 stakeholders from Universities, National and International Research centers, Governmental and UN institutions, Reinsurance companies, Humanitarian agencies

IRDR = Integrated Research on Disaster Risk

The Two EM-DAT Classification Systems

Main classification

Triggering hazard

Associated disasters

Co-occurring or cascading hazards

STAG version

- One disaster, one class
- Hierarchical structure (4 levels)
- Reference glossary
- Any n° of associated disasters
- Flat structure (1 level)
- Possibly different from main class

Disaster Occurrence per Groups

Natural
n=16,523

Technological
n=9,274

Complex
n=14

14% of Disasters Have at Least 1 Associated Disaster

Disaster type association

With MT-AT occurrence ≥ 50

MT: Main Type; AT: Associated Type

Classifying Disasters: From What Sources?

Authoritative Sources - examples

United Nations Agencies, World Bank

National governments, US, EU

Humanitarian agencies (e.g., IFRC)

Re-insurance companies (e.g., AON)

Press Agencies (e.g., AFP)

Manual Classification

EM-DAT

- Event date
- **Disaster type (4 lvl)**
- **Associated disasters**
- Country / location
- Impact variables

Classifying Disasters: For Which **Users**?

Tsunami

Cascading hazard

Associated disaster
Main EM-DAT type

Clarity

Suitability

3 General Categories in EM-DAT

1. Infectious diseases (General)
2. Infestation (General)
3. Wildfire (General)
4. Volcanic activity (General)
5. Flood (General)
6. Storm (General)
7. Industrial accident (General)
8. Miscellaneous accident (General)

Clarity
Homogeneity

Stability
Flexibility

3 Empty Categories in EM-DAT

1. Fungal disease
2. Prion disease
3. Airburst
4. Energetic particles
5. Geomagnetic storms
6. Shockwave
7. Radio disturbance
8. Lahar
9. Ice Jam Flood
10. Rogue wave
11. Seiche

Why empty?

→ Event rarity or lack of data?

Comprehensiveness
Stability

→ Not intelligible enough?

Suitability
Clarity

Main Challenges for EM-DAT Classification

Finding the best trade-offs (Comprehensiveness, Clarity, ...)

... considering **CRED limited capacity** and **classification effort**

Small team size

Limited expert
knowledge
